

The Great Divide -&- The Idiotic Digression

1970 can be considered the primary opportunity divide of recorded human history.

Before 1970 decision making was centered within the understandings of individual human minds. Great minds – some: real, most: pretend - shaped human destiny. Digital computation began contributing to human decisions after 1930, but was not accessible to anyone-who-was-interested until the emergence of personal computers - after 1970; that was The Great Divide. Humanity had & continues to have the opportunity to free itself from the endlessly recurring, socially devastating consequences of the pronouncements, decisions, & actions of hyper-greedy Great Mind Pretenders (**GMP**'s).

The GPS-based automatic navigators that many of us own offer a glimpse into how simple many aspects of life may become in a computation-aided post-GMP world.

The GMP's stayed on as the lead navigators/architects of humanity's post-1970 Idiotic Digression, the digression from actually solving many of humanity's problems. E.g.: Of course "war remains inevitable"... because the GMP's don't imagine, let alone want to invent, let alone have the skills to invent, viable alternative paradigms.

Expect little from one mind, including yours & mine, or suffer scoundrels. For 50 years we've been on the potentially-enduringly-constructive side of the great computation divide.
