Utopian Analysis

Microsoft's Bing Search Engine has elevated constructive human reasoning above all previous paradigms concerning "thinking" by an order of magnitude.

I was awed by the constructive depth of Bing's analysis of my 2013 paper:
https://ftp.setterholm.com/freedomJS.pdf
via the Bing search query: "***commodities expand freedom setterholm***",

The core paradigms of the search engine's brilliance are effortlessly clarified via the query: "***how does bing search detect and analyze philosophical frames of reference***".
Here is Bing's one paragraph summary of Bing's two-page search response:

"**In short:** Bing's detection and analysis of philosophical frames of reference is indirect – it relies on **query understanding, source evaluation, bias mitigation and AI-driven synthesis**, rather than a dedicated philosophical taxonomy (:linked). This means the "frame" you see is shaped by the intersection of your query, Bing's index, and its balancing rules."

Perhaps automated "balancing rules" is the revolutionary augmentation of human thought.
